1 INTRODUCTION

1.1 Terms of Reference

1.1.1 Tweedie Evans Consulting Ltd (TEC) has been appointed by Castleoak Group to undertake a preliminary geoenvironmental and geotechnical assessment of the site located off North Orbital Road, St Albans. All works were undertaken in accordance with our proposal letter dated 16th June 2017 and referenced 1706007.001.bidlet.

1.2 Background

1.2.1 The site is situated off North Orbital Road in the south of St Albans (Figure 1). The site covers an area of approximately 4.0hectares, with the centre situated at approximate National Grid Reference 513690, 203660. The nearest postcode is AL2 2DS.

1.2.2 The site currently comprises an irregular shaped parcel of land utilised as a nursery for the wholesale supply of garden plants.

1.2.3 It is understood that it is proposed to redevelop the site for a residential end use comprising the demolition of pre-existing structures to allow for the construction of a number of single storey and two-storey structures with associated hard infrastructure and soft landscaping (Figure 2).

1.2.4 The aim of these works is to provide information on geoenvironmental and engineering conditions and constraints associated with the site with regard to the proposed development.

1.3 Scope of Works

1.3.1 The scope of work undertaken as part of this report is presented below:

- Preliminary Risk Assessment. This phase of assessment involves development of an initial site conceptual model, based on desk study research and a site reconnaissance survey, in order to establish whether or not there are potentially unacceptable risks.

- Generic Quantitative Risk Assessment. This phase of assessment involves refinement of the site conceptual model developed as part of the Preliminary Risk Assessment based on the findings of an intrusive investigation. Generic assessment criteria and assumptions, if appropriate, are used to evaluate potentially unacceptable risks. Should unacceptable risks be identified, a feasible remediation options appraisal is provided and/or a Detailed Quantitative Risk Assessment is recommended. The purpose of the Detailed Quantitative Risk Assessment is to further refine the conceptual model and use more detailed site specific information and criteria to determine whether there are unacceptable risks.

- Preliminary Geotechnical Assessment. General recommendations regarding likely engineering abnormals are provided on the basis of the findings of an intrusive investigation, together with preliminary foundation design recommendations for the proposed development.

1.3.2 The above scope of work has been undertaken in accordance with current guidance such as CLR 11 *'Model Procedures for the Management of Land Contamination'* (Environment Agency, 2004), BS10175+A1 (2013) and, where appropriate NHBC and Eurocode 7.

1.3.3 The report is presented in the following format.

- Preliminary Risk Assessment:
  Section 2 - Site Description
  Section 3 - Site History
  Section 4 - Environmental Setting
  Section 5 - Outline Conceptual Model

- Generic Quantitative Risk Assessment:
  Section 6 - Intrusive Investigation
  Section 7 - Encountered Ground Conditions
  Section 8 - Contamination Characterisation
  Section 9 - Refined Conceptual Model

- Preliminary Geotechnical Assessment:
  Section 10 - Ground Engineering

- Section 11 - Conclusions and Recommendations

2 SITE DESCRIPTION

2.1 Site Location

2.1.1 The site is located within a mixed commercial / residential area and is bounded by the following features (Table 2.1):

Table 2.1: Site Boundary Features

Direction from Site	Description
North	Pond and residential housing and associated private gardens situated along Mayflower Road.
East	Wooded area known as 'How Wood' beyond which are a number of residential properties with associated private gardens situated along Spruce Drive.
South	Wooded area known as 'Birch Wood' and Birchwood Bungalow (Residential care home and associated private garden). In addition, a telephone mast was observed along the southern site boundary.
West	Surrounding area of Burston Nurseries and associated green houses.

2.2 Land Use and Site Condition

2.2.1 A site reconnaissance survey was undertaken on 17 July 2017. A summary of the observations is presented below. Photographs taken during the site reconnaissance survey are presented in Appendix A.

Current Site Use

2.2.2 The site currently comprises an irregular shaped parcel of land previously utilised as a nursery for the wholesale supply of household plants.

2.2.3 The site is accessed via a track in the north-west corner of the site leading from North Orbital Way.

2.2.4 The north/north-eastern section of the site is generally laid to rough grass (Photographs 1 and 2), while the south/south-western section was observed to contain numerous planting beds covered by a membrane with irrigation system (Photographs 3 and 4). The north/north-western section was observed to contain a number of green houses and outbuildings as well as a number of tanks for the storage of water and fuel (Photographs 5, 8 and 9 to 13) and large shipping container (Photograph 13). Furthermore, a number of burners were observed within the greenhouses (Photograph 14).

Site Topography

2.2.5 The site was observed to be generally flat. An available topographical survey indicates the site is situated at an approximate elevation of 85m above ordnance datum (AOD).

Hard and Soft Landscaping

2.2.6 The site was observed to be lain to a combination of hard and soft landscaping. The north-western section of the site contained numerous buildings and concrete

hardstanding while the south/eastern sections of the site were generally observed to be lain to grass or planting beds.

Fuel Storage

2.2.7 2No. above ground storage tanks (ASTs) were observed within the western section of the site. Both tanks were observed to be of plastic construction situated on a concrete base and were generally noted to be in good condition.

Hazardous Chemicals and Waste Materials Storage

2.2.8 No evidence of hazardous chemical storage was observed on site during the reconnaissance. Notwithstanding this, access to internal areas of a number of the outbuildings was not possible and therefore, the localised storage of possibly hazardous chemicals cannot be discounted.

2.2.9 General household waste materials were observed in a number of locations across the site. Furthermore, an industrial waste bin was observed although the contents of which was not determined during the reconnaissance.

Asbestos Containing Materials

2.2.10 Potential asbestos containing roof tiles and wall sheeting were observed on the outbuildings present within the north-west section of the site.

Site Drainage

2.2.11 A number of manholes assumed to be associated with site drainage were observed across the site, particularly within the western section.

2.2.12 An area of standing water was observed associated with the leaking water tanks located in the north-western site area (Photograph 10).

Evidence of Potential Contamination

2.2.13 No visual or olfactory evidence of potentially gross contamination was observed on site during the reconnaissance.

3 SITE HISTORY

3.1 Introduction

3.1.1 Details of the site history have been obtained through the review of historical Ordnance Survey (OS) mapping. The mapping reviewed is contained within Appendix B.

3.1.2 It is not the purpose of this section to provide a comprehensive account of development history, but only to detail those factors that are or could be relevant to the potentially contaminative history of the site and surrounds and the development of an outline site conceptual model.

3.2 Site History

3.2.1 The following represents a summary of potentially significant features recorded within the site area (Table 3.1).

Table 3.1: Site Features

Site Features	OS Dates
Earliest available mapping (1872) indicates the site remained undeveloped prior to 1999. The site is initially depicted as 2No. fields separated by a hedgerow roughly in the centre of the site in a general east/west orientation. A track is depicted leading from the eastern boundary of the site to Burston Manor farm to the north/north-east of the development area. From 1973, the track and hedgerow is no longer shown.	1872 – 1992
From 1999, the site is depicted in the current layout.	1999 – 2017

3.3 Neighbouring History

3.3.1 The land uses within the immediate vicinity of the site have been considered. Based upon the reviewed map information the following potentially significant features have been identified (Table 3.2).

Table 3.2: Surrounding Features

Surrounding Features	OS Dates	Distance	Direction
Well	1872 – 1924	~10m	Southeast
Moat	1872 – 2017	~30m	Northwest
Gravel Pit	1872 – 1938	*From* 150m	Northwest
Pond	1872 – 1865 1872 - 2017 1924 – 2017 1938 – 2017 1962 – 1992 1979 – 2017	~105m ~230m ~15m ~150m ~20m ~100m	West West Northwest South Southeast Northwest
Nursery	1973 – 2017	~20m	West
Electricity Sub Station	1978 – 1992 1978 – 1992	~50m ~90m	East North
Fisheries	1992 – 2009	~235m	West

4 ENVIRONMENTAL SETTING

4.1 Information Sources

4.1.1 Environmental information for the site has been obtained through review of an Envirocheck® report for the site. This report provides extensive information, obtained from regulatory and commercial sources, regarding the environmental setting of the site. The Envirocheck® report has been included within Appendix C.

4.2 Geology and Hydrogeology

Geology

4.2.1 The Envirocheck® report and published mapping indicates the following geological sequence at the site:

Table 4.1: Geological Setting

Geological Unit	Thickness	BGS Description
Superficial Deposits Lowestoft Formation	Extremely variable. Can be up to 60m.	An extensive sheet of chalky till, with outwash sands and gravels, silts and clays.
Bedrock Lewes Nodular Chalk Formation and Seaford Chalk Formation (Undifferentiated)	Variable - up to ~500m.	Chalk with flints, with discrete marl seams, nodular chalk, sponge-rich and flint seams throughout

4.2.2 A number of BGS historical borehole records are held in proximity to the site. The closest of these (TL10SW378) - located approximately 230m to the east of the site - records the underlying ground materials to comprise firm brown/grey mottled slightly silty clay to a depth of approximately 1.4mbgl underlain by firm to stiff brown/grey sandy clay, becoming sandier with depth, to an approximate depth of 7.6mbgl. This was recorded to be underlain by clayey sandy flint gravel from 7.6mbgl to 8.8mbgl. This was recorded to be underlain by the Upper Chalk to the base of the borehole (10.0mbgl).

4.2.3 The BGS estimated soil chemistry information is recorded within the Envirocheck® as follows:

- Arsenic: <15 mg/kg
- Cadmium: <1.8 mg/kg
- Chromium: 60 – 90 mg/kg
- Lead: <100 mg/kg
- Nickel: 15 – 30 mg/kg

4.2.4 All these values are noted to be below screening values for human health for a residential with homegrown produce end use.

Ground Gas Generation

4.2.5 The natural ground reported to underlie the site (Lowestoft Formation and Upper Chalk) is not considered to comprise a significant source of ground gas generation on site.

4.2.6 Notwithstanding this, made ground if present, may provide a potential source of ground gas generation subject to thickness and composition.

4.2.7 The site is reported to be located within a lower probability radon area, as less than 1% of homes are estimated to be at or above the Action Level. Therefore, no radon protective measures are reported to be necessary in the construction of new dwellings or extensions.

Hydrogeology

4.2.8 The Envirocheck® report and Environment Agency information records the following hydrogeological setting of the site:

Table 4.2: Hydrogeological Setting

Geological Unit	Environment Agency Aquifer Designation	Environment Agency Aquifer Classification
Superficial Deposits Lowestoft Formation	Secondary (Undifferentiated) Aquifer	Assigned in cases where it has not been possible to attribute either category A or B to a rock type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.
Bedrock Lewes Nodular Chalk Formation and Seaford Chalk Formation (Undifferentiated)	Principal Aquifer	Layers of rock or drift deposits that have high intergranular and/or fracture permeability - meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale. In most cases, principal aquifers are aquifers previously designated as major aquifer.

4.2.9 The site is reported to have soils of low leaching potential. These are recorded to comprise soils in which pollutants are unlikely to penetrate the soil layer because water movement is largely horizontal or they have the ability to attenuate diffuse pollutants.

4.2.10 Any potential onsite hydraulic gradient is considered likely to flow in a general easterly direction towards the River Ver.

4.2.11 The site is reported to be located within a Zone II (outer protection zone) and Zone III (Total Catchment) Source Protection Zone (SPZ).

4.2.12 In addition, the site is reported to be located within an area where there is limited potential for groundwater flooding to occur.

4.2.13 There are no licensed groundwater abstractions recorded with 1000m of the site.

4.2.14 A single licensed discharge consent to land/ soakaway is recorded within 250m of the site, as detailed below:

Table 4.3: Licensed Discharge Consents

Receptor	Effluent Type	Distance	Direction
Gravel Strata (Into Land)	Sewage Discharges – Final/Treated Effluent – Not Water Company	~225m	Northwest

4.2.15 Based upon the above information the geological and hydrogeological setting of the site is considered to be of **Moderate Sensitivity**.

4.3 Hydrology

4.3.1 The closest surface water course to the site is a pond adjacent to the northwest boundary of the site. The nearest significant surface water course if the River Ver located ~1km east of the site.

4.3.2 There are no surface water abstractions recorded within 1km of the site. There are no recorded pollution incidents to controlled waters, or discharge consents to surface waters, within 250m of the site.

4.3.3 The site is recorded to be located within an area designated by the Environment Agency as Flood Zone 1.

4.3.4 Given the above information, the hydrology of the site is considered to be of **Low Sensitivity**.

4.4 Environmental Data

4.4.1 Additional pertinent environmental data from the Envirocheck® report for the site is summarised in Table 4.4.

Table 4.4: Additional Pertinent Environmental Data Summary

Category	0-250m	250-500m	Details
Authorisations, Incidents and Registers			
Local Authority Pollution Prevention and Controls	0	1	~435m west: Shell Petrol Station
Current Land Uses			
Potentially contaminative land uses	1	4	*0 to 250m* ~210m northeast: Paint and varnish stripping. *250 to 500m* ~305m north: Asphalt and Coated Macadam Laying Contractors. ~315m southeast: Pest and Vermin Control. ~360m east: plant and machinery repairs. ~450m northwest: Car customisation and conversion specialists.

Category	0-250m	250-500m	Details
Petrol and fuel sites	0	1	~430m west: Shell Chiswell Petrol Filling Station
Waste Management			
Potentially Infilled Land	2	2	~205m west: Unknown Filled Ground (Pond, marsh, river, stream, dock etc) (water), date: 1960 ~210m north-west: Unknown Filled Ground (Pit, quarry etc) (non-water), date: 1990 ~280m north-west: Unknown Filled Ground (Pit, quarry etc) (non-water), date: 1990 ~420m south-east: Unknown Filled Ground (Pond, marsh, river, stream, dock etc) (water), date: 1960
Ecological Designated Areas			
Site of ecological value	2	0	The site is situated within a Nitrate Vulnerable Zone and an area of adopted green belt.

4.5 Engineering Considerations

4.5.1 Engineering considerations identified from the Envirocheck® report for the site are summarised below:

Table 4.5: Engineering Considerations

Hazard	Hazard Potential					
	No Hazard	Negligible	Very Low	Low	Moderate	High
Collapsible ground			X			
Compressible ground	X					
Ground dissolution			X			
Landslide			X			
Running sand			X			
Shrink/swell clays				X		
Coal mining		X				
Non-coal mining		X				

4.5.2 A single BGS mineral site is recorded in proximity to the site. This is located approximately 360m to the north-west of the site for sand and gravel (recorded as ceased).

4.6 Regulatory Consultations

4.6.1 The following regulatory consultation has been undertaken with respect to possible environmental issues and ground conditions on-site and in the surrounding area.

Environmental Health– St Albans City and District Council

4.6.2 Environmental Health at St Albans City and District Council was contacted with regards to any potential contaminated land issues on site and within the surrounding area. The information provided is presented in Appendix D. A summary of the response is provided below.

- The site is reported to have formed part of Burston Manor Farm c.1800's and later part of Burston Nurseries (1970-1990's). A number of potentially contaminative land uses have been recorded by the Council in proximity to the site including the identified historic gravel pit (1800s - 1960), the North Orbital Road, a garage, a hospital and the adjacent Burston Nursery.
- It has been reported by the Council that there are 2No. pollution incidents recorded within 500m of the site. It is reported that these occurred in October 1994 and November 1996 and are understood to be associated with oil or gas spillages, although no further information has been provided.
- It has been reported by the Council that there are no records relating to pre-license landfill sites, known areas of contaminated land, Part B APC authorisations, private water supplies or any sites where petroleum hydrocarbons are stored within 500m of the subject site.
- In addition, the Council do not hold any records regarding previous site investigations or unexploded ordnance in proximity of the site and there are no known ground gas issues within the area. Furthermore, the Council are not aware of any issues regarding naturally elevated contaminant concentrations.

Building Control – St Albans City and District Council

4.6.3 Building Control was contacted with regards to any potential foundation and ground condition issues on site and within the surrounding area. Notwithstanding this, it was reported that no pertinent information was held regarding the site.

4.7 General Summary

4.7.1 Given the above Environmental Setting and the general land use for the area, discussed in Section 2, this site is considered to be of **Low to Moderate Overall Environmental Sensitivity.**

5 OUTLINE CONCEPTUAL MODEL

5.1 Introduction

5.1.1 The assessment of potential risk associated with any identified contamination is based upon the identification and evaluation of Significant Pollutant Linkages.

5.1.2 A Significant Pollutant Linkage exists on a site only if three conditions are satisfied. These conditions are:

- *The presence of substances (potential contaminants / pollutants) that may cause harm (a* Source*)*
- *The presence of a target which may be harmed e.g. site residents, groundwater (a* Receptor*)*
- *A linkage between the Source and the Receptor e.g. ingestion of soil, inhalation of vapour (a* Pathway*)*

5.1.3 In each case, the existence of a pollutant linkage requires that not only does both a Source and a Receptor have to exist but that a demonstrable Pathway also exists. Therefore, the presence of measurable concentrations of contaminants within the ground or groundwater environment does not automatically imply that a contamination problem exists on site.

5.1.4 The nature and importance of both pathways and receptors, which are relevant to a particular site, will vary according to the actual or intended use of the site, its characteristics and its surroundings.

5.1.5 This process of the identification of Pollutant Linkages has been applied below to assess the potential risks associated with the site.

5.2 Hazard Identification

5.2.1 Potentially contaminative current and historic processes have been identified on and within the vicinity of the site and are presented in Table 5.1.

Table 5.1: Identified Potential Hazards

Potential Hazard/Source	Location	Details
Made Ground	On site	Given the development history of the site and observations made during the reconnaissance, the potential for made ground to be present across the site cannot be discounted. Made ground, if present may provide a potential source of ground gas generation subject to thickness and composition.

Potential Hazard/Source	Location	Details
Potentially contaminative current and historic processes	On and off site	A number of potentially contaminative sources have been identified on site during the reconnaissance including above ground fuel storage tanks and burners within the existing green houses. In addition, contaminative sources including electrical substations and former gravel pit have been identified in proximity of the site, which may provide a potential source of onsite contamination/ ground gas.

5.3 Potential Receptors and Pathways

5.3.1 Potential receptors identified as part of this preliminary risk assessment are:

- Current/future site users;
- Construction workers;
- Ecological Receptors; and
- Controlled waters (Principal and Secondary Aquifer).

5.3.2 Potential contaminant pathways relating to the identified receptors and contaminants of concern include:

- Dermal contact – contact with soil, dust or water;
- Ingestion - ingestion of soil, dust or water;
- Inhalation – inhalation of soil, dust or vapours;
- Vertical migration – e.g. seepage of contaminants at the ground surface (i.e. leakage/spillage of hydrocarbons) through cracks in hardstanding and/or leaching of contaminants within the unsaturated zone resulting in vertical contaminant migration; and
- Horizontal migration – e.g. lateral migration of contaminants within the saturated zone and along preferential pathways such as drainage pipe bedding.

5.4 Hazard Assessment and Risk Estimation

5.4.1 Potential significant pollutant linkages identified as part of this preliminary risk assessment are summarised in the Outline Site Conceptual Model presented in Table 5.2. References to risk estimations are made in accordance with the methodology presented in CIRIA publication C552 (2001) titled *'Contaminated Land Risk Assessment: A Guide to Good Practice'* and summarised in Appendix E.

Table 5.2: Outline Conceptual Model (Hazard Assessment and Risk Estimation)

Potential Hazard/ Source	Potential Receptor	Potential Pathway to Receptors	Associated Hazard	Scale of Impact	Potential Consequence of Source-Receptor Linkage	Potential Likelihood for Significant Source-Receptor Linkage	Risk Classification
Made Ground - onsite	Current and future site users and construction workers	Exposure to potential contaminants through ingestion, inhalation and dermal contact.	Risk of harm to human health.	Local	Medium	**Low Likelihood to Likely:** Given the development history of the site, the presence of made ground of unknown chemical composition and thickness cannot be discounted.	**Low to Moderate Risk**
	Controlled waters (Principal and Secondary Aquifers)	Infiltration of water through the unsaturated zone resulting in leaching of potential contaminants and subsequent potential vertical and horizontal migration along preferential pathways.	Risk to controlled waters.	Local to Regional	Low to Medium	**Low Likelihood:** Given the potential for made ground of unknown chemical composition and Secondary and Principal Aquifer designation, a risk to controlled waters cannot be discounted at this stage. However, the underlying soils are reported to have a low leaching potential and therefore, the risk is considered to be low.	**Low to Moderate Risk**
	Future site users and proposed development	Migration, ingress and inhalation of ground gases.	Risk of harm to human health.	Local	Low to Medium	**Low Likelihood:** Made ground may provide a potential source of ground gas generation, subject to thickness and chemical composition.	**Low Risk**
Potentially contaminative current and historic processes – on and off site	Current and future site users	Exposure to potential contaminants through ingestion, inhalation and dermal contact.	Risk of harm to human health.	Local	Low	**Low Likelihood to Likely:** Potentially contaminative land uses have been identified on and in proximity to the site. Therefore, the risk for on-site contamination from on and off site sources cannot be discounted at this stage.	**Low Risk**
	Future site users and proposed development	Migration, ingress and inhalation of ground gases.	Risk of harm to human health.	Local	Low to Medium	**Unlikely to Low Likelihood:** A former gravel pit has been identified within proximity to the site, which may provide a potential source of ground gas generation. Notwithstanding this, given the age, distance and small scale of this feature, and anticipated cohesive nature of the underlying ground materials, the potential for significant lateral migration is considered low. In addition, information provided by the Local Authority indicates there are no known ground gas issues in the area.	**Low Risk**

6 INTRUSIVE INVESTIGATION

6.1 Background

6.1.1 The ground investigation undertaken was designed to provide specific information regarding site conditions in support of the proposed site development.

6.1.2 In particular, the investigation was designed to provide further information on:

- Ground conditions to aid with the design of the development; and
- The potential significant pollutant linkages identified as part of the Preliminary Risk Assessment.

6.1.3 All site works were undertaken in accordance with BS5930:2015, BS10175+A1 (2013) and, where appropriate, Eurocode 7. Works were supervised by a suitably experienced geoenvironmental consultant from TEC.

6.2 Methodology

6.2.1 Intrusive works were undertaken between 17 and 18 July 2017 and comprised the advancement of 8No. dynamic sample boreholes using a Dando Terrier 2002 to allow for the characterisation and description of underlying ground materials and for the collection of near surface and deeper ground materials for geochemical and geotechnical analysis.

6.2.2 In addition, given the low consistency and strength of the encountered ground materials at depth, follow on dynamic probing was undertaken from a depth of 5.0mbgl within 4No locations (WS05 to WS08) and from the ground surface adjacent to the dynamic sample boreholes within 2No locations (WS01 and WS03).

6.2.3 Exploratory hole locations are presented in Figure 3 and the reasoning behind each investigation location is given in Table 6.1, as follows:

Table 6.1: Exploratory Hole Rationale

Location	Location Rationale
WS01 – WS08	• Classification and description of deposits underlying the site; and • Soil sampling of near-surface and deeper ground materials for geochemical and geotechnical testing.
WS05 – WS08 (DP3 – DP6)	• Follow on dynamic probing (DP3 – DP6) from 5.0mbgl to provide an indicative strength profile of the underlying materials.
DP1 – DP2	• Dynamic probing from ground surface, adjacent to WS1 and WS3, to provide indicative strength profile of the underlying materials.

6.2.4 A detailed description of encountered ground conditions are shown on exploratory hole logs presented in Appendix F.

6.3 Field Testing

6.3.1 Standard Penetration Tests (SPTs) were undertaken at regular intervals between 1.0mbgl and 5.0mbgl within the boreholes to gain an indicative strength profile of the underlying materials.

6.3.2 In situ field testing was undertaken on recovered materials using a hand shear vane to provide indicative shear strengths of underlying cohesive materials.

6.4 Chemical Testing

6.4.1 Laboratory testing was scheduled on the basis of field observations.

6.4.2 Representative soil samples were collected and chemically tested at i2 Analytical Ltd, a UKAS/MCERTS accredited laboratory, for a selection of the following parameters:

Soils (Totals)

- *Heavy metals (arsenic, chromium, cadmium, copper, lead, selenium, zinc, barium, mercury, nickel, beryllium, vanadium and water soluble boron);*
- *Phenol (monohydric), cyanide (total), water soluble sulphate, sulphide, total organic carbon, pH;*
- *Speciated Polycyclic Aromatic Hydrocarbons (PAHs);*
- *Pesticide and herbicide screen; and*
- *Asbestos Screen.*

6.4.3 Geochemical certificates of analysis are presented Appendix G.

6.5 Geotechnical Testing

6.5.1 Selected soil samples were submitted for geotechnical analysis at K4 Soils. Laboratory testing was scheduled upon the basis of field observations for a selection of the following:

- *Moisture Content;*
- *Liquid and Plastic Limits;*
- *Particle Size Distribution; and*
- *pH, and Sulphates.*

6.5.2 Soil geotechnical certificates of analysis are presented in Appendix H.

6.6 General Sampling

6.6.1 Soil samples were collected directly into pre-labelled sample containers. During the course of the sampling care was taken to minimise head space of the sample containers. Once filled sample containers were placed within cool boxes containing ice packs to maintain as cool a temperature as possible, nominally 4°C.

6.6.2 Samples were collected by courier for delivery to the selected laboratories. All samples were accompanied by detailed chain of custody sheets.

7 ENCOUNTERED GROUND CONDITIONS

7.1 Introduction

7.1.1 A summary of encountered ground conditions for the site is provided below.

7.1.2 Detailed descriptions of encountered ground conditions are shown on exploratory hole logs presented in Appendix F.

Made Ground

7.1.3 Made ground was encountered across the site to a maximum observed depth of 1.25mbgl (WS06), although generally at depths of <0.5mbgl.

7.1.4 Within the eastern section of the site (i.e. WS01 to WS03) the made ground was generally observed to comprise brown slightly silty slightly gravelly sandy clay with many rootlets to a maximum depth of 0.35mbgl. The gravel component within this material was observed to comprise flint, brick and black carbonaceous material.

7.1.5 Within the western section of the site (i.e. WS04 – WS08), the made ground was observed to generally comprise dark brown gravelly silty sand to a maximum observed depth of 1.25mbgl. The gravel was generally observed to comprise flint, limestone, red brick and concrete.

Natural Ground

7.1.6 The natural ground was encountered from a depth of 0.2mbgl (WS01) to a maximum observed depth of 5.45mbgl. Granular deposits comprising medium dense orange-brown and grey slightly clayey slightly silty sand were observed within WS01 between 0.5mbgl and 2.8mbgl, WS05 between 0.9mbgl and 2.95mbgl and WS08 between 0.4mbgl and 1.95mbgl.

7.1.7 The underlying materials within the remaining exploratory holes were noted to be cohesive in nature, generally comprising orange-brown or brown slightly silty sandy clay. The encountered materials were recorded to vary in consistency and strength, both spatially and with depth with materials recorded as very soft, soft, firm and stiff, while in-situ testing indicated the encountered materials are of variable low to high strength across the site.

7.2 Generalised Ground Profile

7.2.1 The general ground profile encountered at the site is summarised in Table 7.1 below.

Table 7.1: Generalised Ground Profile

Depth (mbgl)	Encountered Material
0.0 – 0.2/1.25	**Made Ground:** *Eastern Section:* Brown slightly silty slightly gravelly sandy clay with gravel of flint, brick and black carbonaceous material. *Western Section:* dark brown gravelly silty sand with gravel of flint, limestone, red brick and concrete.

Depth (mbgl)	Encountered Material
0.2/1.25 - >5.45	**Lowestoft Formation:** Locally granular in nature within WS01, WS05 and WS08 comprising medium dense slightly clayey slightly silty sand to maximum depths of 2.95mbgl. Where cohesive, the underlying materials were generally observed to comprise firm medium to high strength or soft to firm low to medium strength slightly silty slightly sandy clay with localised pockets of very sandy clay or clayey sand. This was generally observed to be underlain by very soft to soft, low strength or firm medium strength slightly silty or slightly sandy clay.

7.3 Groundwater and Perched Water

7.3.1 Water strikes encountered during the site works are shown on the exploratory hole logs in Appendix F and summarised in Table 7.2 below.

Table 7.2: Groundwater Strikes

Location	Date	Groundwater Strike (mbgl)	Strata
WS01	17/06/2017	1.2	Natural
WS02		1.7	
WS03		4.45	
WS04		2.3	
WS05	18/06/2017	1.6	
WS06		1.0	Made Ground
WS07		2.0	Natural
WS08		1.4	

7.3.3 Groundwater was encountered across the site at depths of between 1.2mbgl and 4.45mbgl and was generally observed within sandy silty clay encountered across the site. Perched water within the made ground was encountered within a single location (WS06) at a depth of 1.0mbgl.

7.4 Contamination Summary

7.4.1 No visual or olfactory evidence of potentially gross contamination was encountered on site during the intrusive works.

8 CONTAMINATION CHARACTERISATION

8.1 Legislation

8.1.1 Contaminated Land is defined in Part IIA of the Environmental Protection Act (1990) as:

8.1.2 "Any land which appears to the Local Authority in whose area it is situated to be in such a condition, by reasons of substances in, on or under the land that:

- Significant harm is being caused or there is a significant possibility of such harm being caused;

or

- *significant pollution of controlled waters is being caused or there is a significant possibility of such pollution being caused."

**Section 86 of the Water Act 2003 amends section 78A of Environmental Protection Act 1990 for Controlled Waters.*

8.2 Generic Quantitative Risk Assessment

Human Health Screening

8.2.1 Current legislation and guidance on the assessment of contaminated land promotes a tiered risk approach (CLR 11). The generic quantitative risk assessment comprises a screening of identified contaminants against generic guideline values that are appropriate to the site setting and the receptors concerned. For risks to human health the basis for these generic guideline values are the methodologies set out by the Environment Agency's Contaminated Land Exposure Assessment (CLEA) guidelines.

8.2.2 The following regulatory and industry guidance has been utilised for the selection of Generic Assessment Criteria utilised as part of the GQRA. The order of the guidance listed is in terms of hierarchy for selection of GACs (where the land uses and parameters are considered most applicable).

1. *Category 4 Screen Levels (C4SLs) – DEFRA (2014)*
2. *Soil Guidance Values (SGVs) – Environment Agency (2009)*
3. *Suitable For Use Levels (S4ULs) – LQM/CIEH (2015)*
4. *EIC/AGS/CL:AIRE GAC (2009)*

8.2.3 The C4SLs for arsenic, cadmium, chromium (VI) and lead have been utilised as part of the GQRA. Benzene and benzo(a)pyrene C4SLs have not been utilised as part of the Tier 1 screening as they are based upon 6% soil organic matter (SOM) as opposed to 1% SOM utilised by LQM/CIEH (2015).

8.2.4 SGVs have been utilised, where appropriate, for dioxins, furans and dioxin-like PCBs; nickel; inorganic mercury and selenium (residential SGV used for proposed residential end use). SGVs for organic compounds are not utilised as they are derived using a 6% soil organic matter as opposed to 1% SOM utilised by LQM/CIEH (2015).

8.2.5 In the absence of a published UK derived GAC for cyanide, the GQRA for total cyanide is based upon comparison of recorded values against the Dutch Intervention Value for free cyanide (VROM 2000).

8.2.6 S4ULs and EIC/AGS/CL:AIRE GACs are adopted for the remaining potential contaminants using the hierarchy noted above.

8.2.7 The purpose of the site investigation was to provide information to establish the suitability of the site for a residential development. Therefore, the standard land use for the site, for use in the generic assessment, has been defined as "*Residential with homegrown produce*" in accordance with current guidance.

Ground Gas Screening

8.2.8 An initial qualitative risk screening assessment based upon the methodology for characterising gassing sites detailed within the following documents has been undertaken:

- CIRIA Report C665 (2007) '*Assessing risks posed by hazardous ground gases to buildings (revised)'*;
- NHBC (March 2007) '*Guidance on evaluation of development proposals on sites where methane and carbon dioxide are present'*;
- BS8485:2015 *'Code of Practice for the characterisation and remediation from ground gas in affected developments'*;
- BS8576:2013 '*Guidance on investigations for ground gas – Permanent gases and Volatile Organic Compounds (VOCs)';* and
- Wilson S., Card C*.* and Haines S. (2009) '*Ground Gas Handbook'*.

8.2.9 The objectives of the screening assessment are to provide a general characterisation of the ground materials within the site based on the investigation works undertaken to-date. This information is used to provide a preliminary assessment of gassing potential for the materials encountered at the site. This, together with ground gas data collected as part of the monitoring undertaken to date, is used to provide a qualitative conceptual model of identified risk in relation to the proposed development.

8.3 Soil Analysis - Human Health

8.3.1 Soil samples were collected and analysed from made ground materials. Certificates of analysis for samples are contained within Appendix G.

8.3.2 Current regulatory guidance for the statistical assessment of environmental data within a contaminated land context is detailed within the CIEH and CL:AIRE joint publication titled '*Guidance on Comparing Soil Concentration Data with a Critical Concentration'* (2008). However, as judgemental sampling has been undertaken, statistical assessment as detailed in CL:AIRE (2008) has not been carried out as part of this assessment. Therefore, to identify Contaminants of Potential Concern (COPC) as part of this preliminary assessment, the analytical results for the ground materials sampled have been assessed by the screening of individual analyses against the relevant Tier 1 Site Screening Values (SSVs) adopted.

8.3.3 For generic assessment purposes, SSVs have been conservatively selected, where appropriate, based upon a sandy soil and Soil Organic Matter (SOM) of 1%.

Made Ground

8.3.4 10No. samples of made ground were scheduled for analysis from the site. The results obtained from made ground are summarised in Table 8.1 below:

Table 8.1: Soil Analysis Summary

Contaminant	Max (mg/kg)	Min (mg/kg)	SSV[1] (mg/kg)	No. of Tests	No. of Exceedances
Arsenic	15	6.0	37(1)	10	0
Boron	2.6	0.5	290(3)	10	0
Cadmium	0.4	<0.2	22(1)	10	0
Chromium (total)	29	9	910(3)	10	0
Chromium (VI)	<1.2	<1.2	21(1)	10	0
Copper	67	11	2400(3)	10	0
Lead	120	32	200(1)	10	0
Mercury	<0.3	<0.3	170(2)	10	0
Nickel	36	6.1	130(2)	10	0
Selenium	<1.0	<1.0	350(2)	10	0
Zinc	130	31	3700(3)	10	0
Beryllium	1.1	0.33	1.7(3)	10	0
Vanadium	42	18	410(3)	10	0
Barium	170	23	1300(4)	10	0
Cyanide (Total)	<1	<1	20(5)	10	0
Total Phenol (Monohydric)	<1.0	<1.0	120(3)	10	0
Water Soluble Sulphate (SO_4) – g/l	0.0534	0.0019	-	10	0
Sulphide	4.4	<1.0	-	10	0
pH	8.6	6.6	-	10	0

Notes:

1 DEFRA C4SLs (2014) based on "*Residential with homegrown produce"* end use
2 Environment Agency SGVs (2009) based on "*Residential"* end use
3 LQM/CIEH S4ULs (2015) based on "*Residential with homegrown produce"* end use
4 CL:AIRE, AGS & EIS (2009) based on "*Residential*" end use
5 Dutch Intervention Value for free cyanide (VROM 2000)
6 Reported as Laboratory Limit of Detection (LOD)

8.3.5 Exceedances of the Tier 1 SSVs for a residential site end use were recorded with the made ground for a number of PAHs, as detailed below:

- Benzo(a)anthracene – WS05 at 0.1-0.3mbgl (16mg/kg); and WS07 at 0.1-0.6mbgl (9.2mg/kg);
- Benzo(b)fluoranthene – WS05 at 0.1-0.3mbgl (17mg/kg); WS06 at 0.0-0.1mbgl (18mg/kg); and WS07 at 0.1-0.6mbgl (11mg/kg); and
- Benzo(a)pyrene - WS05 at 0.1-0.3mbgl (18mg/kg); WS06 at 0.0-0.1mbgl (19mg/kg); and WS07 at 0.1-0.6mbgl (8.0mg/kg);

8.3.6 In addition, an asbestos screen undertaken on all representative samples of the made ground recorded the presence of asbestos in a single location (WS07 at 0.1-0.6mbgl), described as Chrysotile loose fibres and hard/cement type material. All remaining samples recorded asbestos as 'not-detected'.

8.3.7 The exceedances and asbestos are noted to be within the made ground in the western area of the site around the greenhouses and outbuildings/ tanks. No exceedances of the Tier 1 SSVs have been recorded in the eastern site area, which was observed to be undeveloped.

8.3.8 Furthermore, a pesticide and herbicide screen undertaken 4No. representative samples of the made ground recorded pesticides and herbicides as 'not-detected' in all samples.

8.4 Ground Gas

8.4.1 In accordance with the guidance presented within the CL:AIRE Research Bulletin (RB17, 2012) and BS8485:2015, bulk ground gas monitoring has not been undertaken as part of this assessment as;

- No significant thickness of made ground was encountered at the site (maximum of 1.25mbgl, although generally <0.5mbgl). Made ground materials were observed to be of generally low degradable content with recorded TOCs between 0.2% and 4.5%.

8.4.2 While a former gravel pit has been identified within proximity of the site, no information is available to suggest this has been infilled by materials that may provide

a potential source of ground gas generation. Furthermore, information provided by St Albans City and District Environmental Health team indicates there are no known ground gas issues in the area.

8.4.3 In addition, given the distance to the former gravel pit (>150m), the small scale of this feature, and the generally cohesive nature of the underlying ground materials, significant lateral migration of ground gas is considered unlikely and no credible pathway has been identified based on the conceptual understanding of the site.

9 REFINED CONCEPTUAL MODEL

9.1 Introduction

9.1.1 The Preliminary Risk Assessment undertaken as part of this report identified the presence of potential significant pollutant linkages associated with the site and surrounds. Therefore, in accordance with the approach recommended in CLR11, additional information was collected about the site and its surroundings as part of a Generic Quantitative Risk Assessment. Based upon this additional information and the proposed development layout, the site conceptual model has been refined and pollutant linkages confirmed for evaluation where considered necessary.

9.2 Hazard Identification

9.2.1 Potential sources of contamination have been identified on and within the vicinity of the site and are presented in Table 9.1.

Table 9.1: Identified Hazards

Identified Hazard/Source	Location	Details
Made Ground	On site	Made ground has been recorded across the site to a maximum observed depth of 1.25mbgl. Laboratory analysis of representative made ground materials recorded the exceedance of Tier 1 SSVs for a number of PAH's when considering a residential site end use and asbestos fibres/ hard cement type asbestos within the made ground in the western area of the site only. The made ground encountered on site is not considered to be a potential source of significant ground gas generation based on the limited thickness and reported low degradable organic content.
Potentially contaminative current and historic land uses	On and off site	Fuel storage (ASTs) have been identified on site. Notwithstanding this, field observations and laboratory analysis do not indicate the presence of potentially significant and widespread hydrocarbon impact within vicinity of these features. Limited potentially contaminative current and historical processes have been identified in proximity to the site (including electrical sub-stations). However, given the small scale of these identified features and based on site observations, field testing and laboratory analysis, together with the generally cohesive nature of the underlying natural ground materials, the potential for on-site contaminant migration is considered unlikely.

9.3 Identified Potential Receptors and Pathways

9.3.1 Potential receptors identified as part of the generic risk assessment are:

- Current/future site users;
- Construction workers; and
- Controlled waters (Principal / Secondary Aquifer).

9.3.2 Potential contaminant pathways identified as part of the generic risk assessment include:

- Dermal contact – contact with soil, dust or water;
- Ingestion - ingestion of soil, dust or water;
- Inhalation – inhalation of soil, dust or vapours;
- Vertical migration – e.g. seepage of contaminants at the ground surface (i.e. leakage/spillage of hydrocarbons) through cracks in hardstanding and/or leaching of contaminants within the unsaturated zone resulting in vertical contaminant migration; and
- Horizontal migration – e.g. lateral migration of contaminants within the saturated zone and along preferential pathways such as drainage pipe bedding.

9.4 Hazard Assessment and Risk Estimation

9.4.1 Potential significant pollutant linkages identified following completion of the intrusive works are summarised in the Refined Site Conceptual Model presented in Table 9.2.

Table 9.2: Refined Conceptual Model (Hazard Assessment and Risk Estimation)

Identified Hazard/ Source	Identified Receptor	Potential Pathway to Receptors	Associated Hazard	Scale of Impact	Potential Consequence of Source-Receptor Linkage	Potential Likelihood for Significant Source-Receptor Linkage	Risk Classification
Made Ground – on site	Current and future site end users and construction workers	Exposure to potential contaminants through ingestion, inhalation and dermal contact	Risk of harm to human health	Local	Medium	**Low Likelihood:** A number of exceedances of the Tier 1 SSVs for a residential site end use for PAH's, and asbestos fibres, have been reported within the made ground encountered in the western area of the site. Therefore, based on the works to date, a potential risk to site end users exists where made ground remains within the proposed garden/ soft landscaped areas in the western area of the site.	**Low to Moderate Risk**
	Controlled waters and ecological receptors	Infiltration of water through the unsaturated zone resulting in leaching of contaminants and potential vertical and horizontal migration along preferential pathways	Risk to Secondary and Principal Aquifer	Local to regional	Medium	**Unlikely:** While elevated total contaminant concentrations of a number of PAHs have been recorded on site in relation to human health SSVs, given the nature and the concentrations of the contamination recorded and the general cohesive nature of the underlying natural materials, a significant risk to controlled waters is considered unlikely.	**Low Risk**
	Future site end users and proposed development	Migration, ingress and inhalation of ground gasses.	Risk of harm to human health	Local	Medium to Severe	**Unlikely**: The made ground encountered on site is not considered to be a significant source of ground gas generation given its limited thickness and composition.	**Low Risk**
Potentially Contaminative Land uses – on site (Petroleum Hydrocarbon storage)	Current and future site end users and construction workers	Potential presence and migration of residual hydrocarbon contamination. Exposure to potential contaminants through ingestion, inhalation and dermal contact.	Risk of harm to human health	Local to regional	Medium	**Low Likelihood:** 2No ASTs and associated infrastructure were observed within the development area. Notwithstanding this, field observations and laboratory analysis has not identified the presence of significant hydrocarbon impact at the site. However, the potential for localised hydrocarbon contamination (particularly within the area of the fuel lines) cannot be fully discounted.	**Low (locally Low to Moderate) Risk**
Potentially Contaminative Land uses – off site	Current and future site end users, construction workers, controlled waters	Potential on-site migration of contamination. Exposure to potential contaminants through ingestion, inhalation and dermal contact.	Risk of harm to human health and Secondary and Principal Aquifer	Local to regional	Medium	**Unlikely:** Limited potentially contaminative current and historic process have been recorded in close proximity to the site. However, no evidence of on-site contaminant migration was recorded during the intrusive works and the underlying shallow deposits <5m) were recorded to be typically cohesive.	**Low Risk**

10 GROUND ENGINEERING

10.1 Proposed Development

10.1.1 It is understood that it is proposed to redevelop the site for a residential end use. comprising the demolition of pre-existing structures to allow for the construction of a number of single storey and two-storey structures with associated hard infrastructure and soft landscaping

10.1.2 Full details pertaining to the potential loads associated with the proposed development have not been provided to date.

Site Preparation

10.1.3 A number of utility services exist within the proposed development including gas and water. Due consideration should be given to the removal / re-routing of these features prior to construction.

10.1.4 Consideration will need to be given to the removal of hard standing encountered on site and to any foundations associated with existing/historic structures on site.

10.1.5 In addition, 2No. above ground storage tanks have been recorded on site. Appropriate decommissioning of these features and subsequent removal will be required prior to the redevelopment of the site.

10.2 Ground Conditions

10.2.1 The general ground profile encountered at the site is summarised in Table 10.1 below.

Table 10.1: Generalised Ground Profile

Depth (mbgl)	Encountered Material
0.0 – 0.2/1.25	**Made Ground:** *Eastern Section:* Brown slightly silty slightly gravelly sandy clay with gravel of flint, brick and black carbonaceous material. *Western Section:* dark brown gravelly silty sand with gravel of flint, limestone, red brick and concrete.
0.2/1.25 - >5.45	**Lowestoft Formation:** Locally granular in nature within WS01, WS05 and WS08 comprising medium dense slightly clayey slightly silty sand to maximum depths of 2.95mbgl. Where cohesive, the underlying materials were generally observed to comprise firm medium to high strength or soft to firm low to medium strength slightly silty slightly sandy clay with localised pockets of very sandy clay or clayey sand. This was generally observed to be underlain by very soft to soft, low strength or firm medium strength slightly silty or slightly sandy clay.

Made Ground

10.2.2 No geotechnical testing was undertaken on samples of the made ground. However, as a part of the geochemical testing undertaken for the site, pH and sulphate testing was undertaken on samples of encountered made ground. The test data indicated sulphate concentrations in the range of 0.0019g/l to 0.0534g/l and pH values of 6.6 to 8.6.

Natural Strata

10.2.3 Geotechnical test results are discussed below. Geotechnical laboratory test certificates are provided in Appendix H with in-situ tests being presented on the exploratory hole logs in Appendix F of this report.

10.2.4 Laboratory analysis was conducted on 8No. representative samples of the underlying superficial deposits. The results of these analyses are presented in Table 10.2 below.

Table 10.2: Summary of Laboratory Test Results - Natural Strata

Test	Number of Tests	Range of Results
Plasticity Index (%)	4	26 – 49
Moisture Content (%)	4	27 – 33
% passing 425µm sieve	4	75 – 100
Particle Size Distribution	2	See Below
pH Value	6	6.31 – 7.82
SO_4 (g/l in soil)	6	0.27 – 0.40

10.2.5 The Plasticity Indices and Modified Plasticity Indices of the encountered cohesive materials ranged between 26% and 49%, suggesting the underlying material is Medium to High Volume Change Potential, as defined by the NHBC (2017).

10.2.6 2No. Particle Size Distribution (PSD) tests, undertaken on representative samples of the underlying granular materials, records the material to comprise silty clayey sand with a gravel component of 0.1% recorded for both samples, a clay component of between 6.5% and 12.4%, a silt component of between 8.2% and 10.1% and a sand component of between 77.4% and 85.2% recorded.

10.2.7 A summary of the Standard Penetration Test (SPT) 'N' values and hand shear vane (HSV) testing undertaken in the exploratory hole locations is summarised within Table 10.3 below:

Table 10.3: Summary of Field Test Results

Depth (mbgl)	Encountered Material	SPT 'N' Values	Hand Shear Vane Results (kN/m^2)
0.5/0.9 – 1.95/2.95	*Lowestoft Formation (Granular): medium dense slightly clayey slightly silty sand*	11 - 22	-
0.2/1.25 – >5.0/5.45	*Lowestoft Formation (Cohesive): slightly silty sandy clay with localised pockets of very sandy clay or clayey sand.*	0 - 16	20 - 125

10.2.8 SPT 'N' values ranged between 11 and 22 within the upper granular materials recorded to underlie the site suggesting they are generally of medium density. 'N' values within the cohesive deposits ranged between 0 and 16 suggesting the materials are of very soft to stiff consistency and were noted to vary in strength, both with depth and across

the site. HSV testing undertaken within the underlying cohesive materials ranged between 20kPa and 125kPa suggesting the materials are of very low to high strength and again were noted to be variable in strength both spatially and with depth.

10.2.9 Follow on dynamic probing from 5.0m depth was undertaken within 4No. locations (WS05 – WS08) and from the ground surface adjacent to WS01 and WS03 to depths of approximately 9.0mbgl to 10.0mbgl. (Appendix I). Based on tentative correlations with the dynamic probe results and observed ground conditions, correlated SPT 'N' values between 0 and 20 can be derived for the upper 5m of encountered deposits (Warren 2007).

10.2.10 The ground conditions below depths of 5.0m have not been observed as part of these works. However, the dynamic probing indicates an increase in strength of the ground materials at depths around 6-7m in the east and 7-9m in the west. This increase in strength may be associated with the base of the superficial deposits and the presence of chalk materials although this cannot be confirmed at this stage.

10.2.11 Using standard correlations with the SPT data, e.g. Stroud (1988), estimated consolidation parameters obtained for the natural materials with a significant cohesive component, recorded within the proposed development area, would suggest a coefficient of compressibility, m_v, of between ~0.15m^2/MN and >2m^2/MN, suggesting a medium to very high compressibility for the encountered cohesive materials.

10.2.12 The geotechnical testing included the analysis for water soluble sulphate and pH testing, with results indicating water soluble sulphate concentrations between 0.27g/l and 0.40g/l and pH values between 6.31 and 7.82.

10.3 Foundations

Ground Conditions

10.3.1 Made ground was observed across the site to a maximum observed depth of 1.25mbgl. This was observed to be underlain by Lowestoft Formation comprising either medium dense slightly clayey slightly silty sand or cohesive materials comprising slightly silty sandy clay that were recorded to be variable in both strength and consistency.

Preliminary Foundation Design Recommendations

10.3.2 Given the shallow groundwater recorded on site, variable consistency and strength of the underlying superficial deposits and potential loads associated with the proposed development, conventional foundations may not be suitable for the proposed development. Notwithstanding this, it is noted that some buildings may only be single storey bungalows and locally higher strength deposits have been recorded in some areas of the site. Therefore, it may be possible to use conventional foundations for lighter loaded structures but further investigation would be required to confirm the feasibility of this option.

10.3.3 For the majority of the site, it is suggested that a piled foundation solution may be most suitable for the proposed structures. It is likely that piles will need to be taken to the competent ground (i.e. the underlying chalk, which from limited dynamic probing is thought to be encountered at depths of generally around 7-9.0mbgl). However, additional intrusive works will be required in order to determine appropriate design parameters for this option.

10.3.4 Furthermore, as the underlying superficial deposits have been shown to exhibit a medium to high volume change potential, in accordance with NHBC (2017) guidance,

appropriate voids should be allowed for within the design, i.e. a minimum of 150mm below and 35mm against the sides of any ground beams.

10.4 Ground Floor Slabs

10.4.1 Based upon the encountered ground conditions together with the proposed founding method, a ground bearing slab may not be suitable.

10.4.2 This being the case, and due to the medium to high volume change potential of the underlying superficial deposits, a minimum void of 150mm should be utilised where suspended in situ concrete flooring is incorporated into the design and where pre-cast concrete suspended floors are used a minimum void space of 300mm should be utilised to allow for 150mm of ventilation.

10.4.3 Should shallow foundations be feasible and foundations are less than 1m depth, the use of a ground bearing slab may be appropriate and it would be recommended that a granular (or stabilised) blanket of at least 500mm is employed below the slab.

10.5 Preliminary Pavement Design

10.5.1 In situ testing using a Dynamic Cone Penetrometer (DCP-TRL) was undertaken at 4No. locations across the site with the results of this testing presented in Appendix J.

10.5.2 Using the calculations outlined in Jones CR and J Rolt (1991), the results indicate California Bearing Ratio (CBR) values between 2.1% and >20% at assumed formation level (>500mm).

10.5.3 In addition, based on correlations with plasticity indices using the Design Manual for Roads and Bridges IAN 73/06 Revision 1 (2009) and observations made on site during the intrusive works, a CBR value of 2% to 3% may be considered appropriate for the encountered shallow natural ground materials.

10.5.4 Therefore, based upon the data obtained to-date a CBR value of <2.5% is recommended for preliminary design purposes where road formation is proven to be within either natural ground deposits or made ground. Further in situ CBR or plate bearing tests would be recommended to refine this recommendation.

10.5.5 It should be noted that all road formations should be proof rolled and soft spots removed and replaced with selected granular fill and, where adoptable, a pavement of sufficient thickness to prevent the penetration of frost should be employed.

10.6 Excavations

10.6.1 Excavations of materials immediately beneath the site should be achievable using conventional excavation plant.

10.6.2 Groundwater were encountered at across the site during the intrusive works at depths of between 1.2mbgl and 4.45mbgl. Therefore, dewatering works may be required during excavation and formation works.

10.7 Protection of Buried Concrete

10.7.1 The results of the water soluble sulphate contact and pH testing carried out on samples of the underlying natural ground indicate that in accordance with BRE Special Digest 1 (2005) these materials would yield an Aggressive Chemical Environment Class (ACEC) of AC-1, requiring a Design Sulphate Class of DS-1.

11 CONCLUSIONS & RECOMMENDATIONS

11.1 Conclusions

11.1.1 Tweedie Evans Consulting Ltd (TEC) has been appointed by Castleoak Group to undertake a preliminary geoenvironmental and geotechnical assessment of North Orbital Road, St Albans. All works were undertaken in accordance with our proposal letter dated 16th June 2017 and referenced 1706007.001.bidlet.

11.1.2 The site is situated off North Orbital Road in the south of St Albans. The site covers an area of approximately 4.0hectares, with the centre of the site situated at approximate National Grid Reference 513690, 203660. The nearest postcode is AL2 2DS.

11.1.3 The site currently comprises an irregular shaped parcel of land utilised as a nursery for the wholesale supply of garden plants.

11.1.4 It is understood that it is proposed to redevelop the site for a residential end use. comprising the demolition of pre-existing structures to allow for the construction of a number of single storey and two-storey structures with associated hard infrastructure and soft landscaping.

11.1.5 The site is considered to be of low to moderate environmental sensitivity due primarily to the underlying ground materials being classified as Secondary and Principal Aquifers and the site being located within a Zone II and Zone III Source Protection Zone. However, there are no groundwater abstractions recorded within 1km of the site and the nearest significant water course if the River Ver located over 1km east.

11.1.6 A limited number of potentially contaminative land uses were identified on and in proximity to the site including above ground fuel storage tanks, electrical sub-stations and a former gravel pit.

11.1.7 Made ground was recorded across the site to depths of between 0.2mbgl and 1.25mbgl (although generally <0.5m). Laboratory analysis of representative made ground materials recorded the exceedance of Tier 1 SSVs for a number of PAHs when considering a residential site end use. In addition, asbestos, recorded as Chrysotile loose fibres and hard/cement type material was encountered in a single sample of the made ground. The exceedances of the SSVs and the asbestos materials were recorded within the made ground in the western half of the site only, within the area of the greenhouses, tanks and outbuildings. No exceedances of Tier 1 SSV have been recorded within the undeveloped eastern area of the site.

11.1.8 No visual or olfactory evidence of potentially significant contamination was observed during the intrusive works at the site. In addition, laboratory analysis did not indicate the presence of potentially significant and widespread hydrocarbon impact associated with the identified ASTs. However, given the presence of ASTs on site, the potential for localised, residual hydrocarbon contamination beneath and around these features cannot be fully discounted.

11.1.9 The encountered made ground and natural ground deposits are not considered to represent a potential source of significant ground gas. A former gravel pit was identified ~150m from the site. However, given the thickness of cohesive deposits on site, the distance from which the pit is located from the site and the small scale of this feature, the potential for significant lateral on-site migration of ground gas from this historical feature is considered to be unlikely. In addition, information provided by the local authority indicates there are no known ground gas issues in proximity to the site.

11.1.10 Based upon our current conceptual understanding of the site and proposed end use, the following Significant Pollutant Linkages have been identified:

- Human health (future site end users and construction workers) - exposure to potential contaminants (PAH and asbestos) within made ground at the site via the ingestion, dermal contact and inhalation pathways;
- Human health (future site end users and construction workers) - exposure to potential residual hydrocarbon contamination within the area of the ASTs and associated fuel lines via the ingestion, dermal contact and inhalation pathways; and
- Controlled waters (Secondary and Principal Aquifers) – highly localised potential low risk of vertical migration of hydrocarbons from historical spills and leakages associated with the ASTs and fuel lines.

11.2 Geoenvironmental Risk Management Recommendations

Identification of Feasible Remediation Options

11.2.1 Significant risks identified within the conceptual model can be mitigated through the breaking of the significant pollution linkage by the removal of at least the source, receptor or pathway. Within reference to the site's conceptual models the following preliminary remediation approach has been prepared. This preliminary remediation approach will need to be presented in more detail within a Remediation Strategy, the content of which will require agreement in writing of the Regulatory Authorities prior to commencing any remediation on site.

Human Health

11.2.2 To aid in mitigating against the risks to human health identified on site, it is recommended that all tanks (together with associated infrastructure) and any associated significantly hydrocarbon impacted ground materials, should they be present, be removed. In addition, it is recommended that during development and ground works, particularly within the areas of the tanks and fuel lines, a watching brief is undertaken by a suitably experienced geoenvironmental consultant, to ensure that significant or widespread contamination is not present. Should such contamination be identified further assessment/remediation may be required.

11.2.3 Given the presence of elevated contaminant concentrations within the made ground encountered in the western area of the site, it is also currently recommended that a suitable cover system be provided within the areas proposed for soft landscaping in this part of the site. Notwithstanding this, further analysis of the made ground (and potentially the natural ground) may be undertaken to confirm the presence, or otherwise, of elevated contaminant concentrations within proposed soft landscaped areas following site preparation/ site strip works. The presence of hardstanding would also mitigate against the potential risks to site end users from the identified general contamination within the made ground.

11.2.4 No remedial works are considered to be required for the eastern, undeveloped area of the site based on the works undertaken to date.

11.2.5 Given the presence of made ground across the site and identified contaminants, good brownfield site working practices should be adopted by construction workers to mitigate against identified potential risks.

11.2.6 Should water pipes be placed within the made ground on site, due consideration should be given to the UK Water Industry Research Ltd (UKWIR) guidance.

Ground Gas and Vapours

11.2.7 No credible source or pathway for a potential risk from ground gas generation and migration has been identified as part of this assessment.

Waste

11.2.8 Waste Acceptance Criteria (WAC) testing has not been carried out as part of this assessment. The geochemical analysis results may be used to aid in Basic Characterisation for potential waste materials produced at the site although WAC testing may be required to be undertaken to support any off-site disposal of materials generated as part of the development works.

11.3 Ground Engineering

11.3.1 Made ground was encountered across the site to depths of between 0.2mbgl and 1.25mbgl. This was observed to be underlain by variable Superficial Deposits to depths in excess of 5.45mbgl. While the underlying Upper Chalk was not encountered during the intrusive works, on the basis of limited dynamic probing undertaken on site, it is considered likely that the chalk may be present from depths of between ~7.0mbgl and 9.5mbgl across the site.

Preliminary Foundation Design Recommendations

11.3.2 Given the shallow groundwater recorded on site, variable consistency and strength of the underlying superficial deposits and potential loads associated with the proposed development, conventional foundations may not be suitable for the proposed development. Notwithstanding this, it is noted that some buildings may only be single storey bungalows and locally higher strength deposits have been recorded in some areas of the site. Therefore, it may be possible to use conventional foundations for lighter loaded structures but further investigation would be required to confirm the feasibility of this option.

11.3.3 For the majority of the site, it is suggested that a piled foundation solution may be most suitable for the proposed structures. It is likely that piles will need to be taken to the competent ground (i.e. the underlying chalk, which from limited dynamic probing is thought to be encountered at depths of generally around 7-9.0mbgl). However, additional intrusive works will be required in order to determine appropriate design parameters for this option.

11.3.4 Furthermore, as the underlying superficial deposits have been shown to exhibit a medium to high volume change potential, in accordance with NHBC (2017) guidance, appropriate voids should be allowed for within the design, i.e. a minimum of 150mm below and 35mm against the sides of any ground beams.

11.4 Ground Floor Slabs

11.4.1 Based upon the encountered ground conditions together with the proposed founding method, a ground bearing slab may not be suitable.

11.4.2 This being the case, and due to the medium to high volume change potential of the underlying superficial deposits, a minimum void of 150mm should be utilised where suspended in situ concrete flooring is incorporated into the design and where pre-cast concrete suspended floors are used a minimum void space of 300mm should be utilised to allow for 150mm of ventilation.

11.4.3 Should shallow foundations be feasible and foundations are less than 1m depth, the use of a ground bearing slab may be appropriate and it would be recommended that a granular (or stabilised) blanket of at least 500mm is employed below the slab.

11.5 Preliminary Pavement Design

11.5.1 Based upon the data obtained to-date a CBR value of <2.5% is recommended for preliminary design purposes where road formation is proven to be within either natural ground deposits or made ground. Further in situ CBR or plate bearing tests would be recommended to refine this recommendation.

11.5.2 It should be noted that all road formations should be proof rolled and soft spots removed and replaced with selected granular fill and, where adoptable, a pavement of sufficient thickness to prevent the penetration of frost should be employed.

11.6 Excavations

11.6.1 Excavations of materials immediately beneath the site should be achievable using conventional excavation plant.

11.6.2 Groundwater were encountered at across the site during the intrusive works at depths of between 1.2mbgl and 4.45mbgl. Therefore, dewatering works may be required during excavation and formation works.

11.7 Protection of Buried Concrete

11.7.1 The results of the water soluble sulphate contact and pH testing carried out on samples of the underlying natural ground indicate that in accordance with BRE Special Digest 1 (2005) these materials would yield an Aggressive Chemical Environment Class (ACEC) of AC-1, requiring a Design Sulphate Class of DS-1.

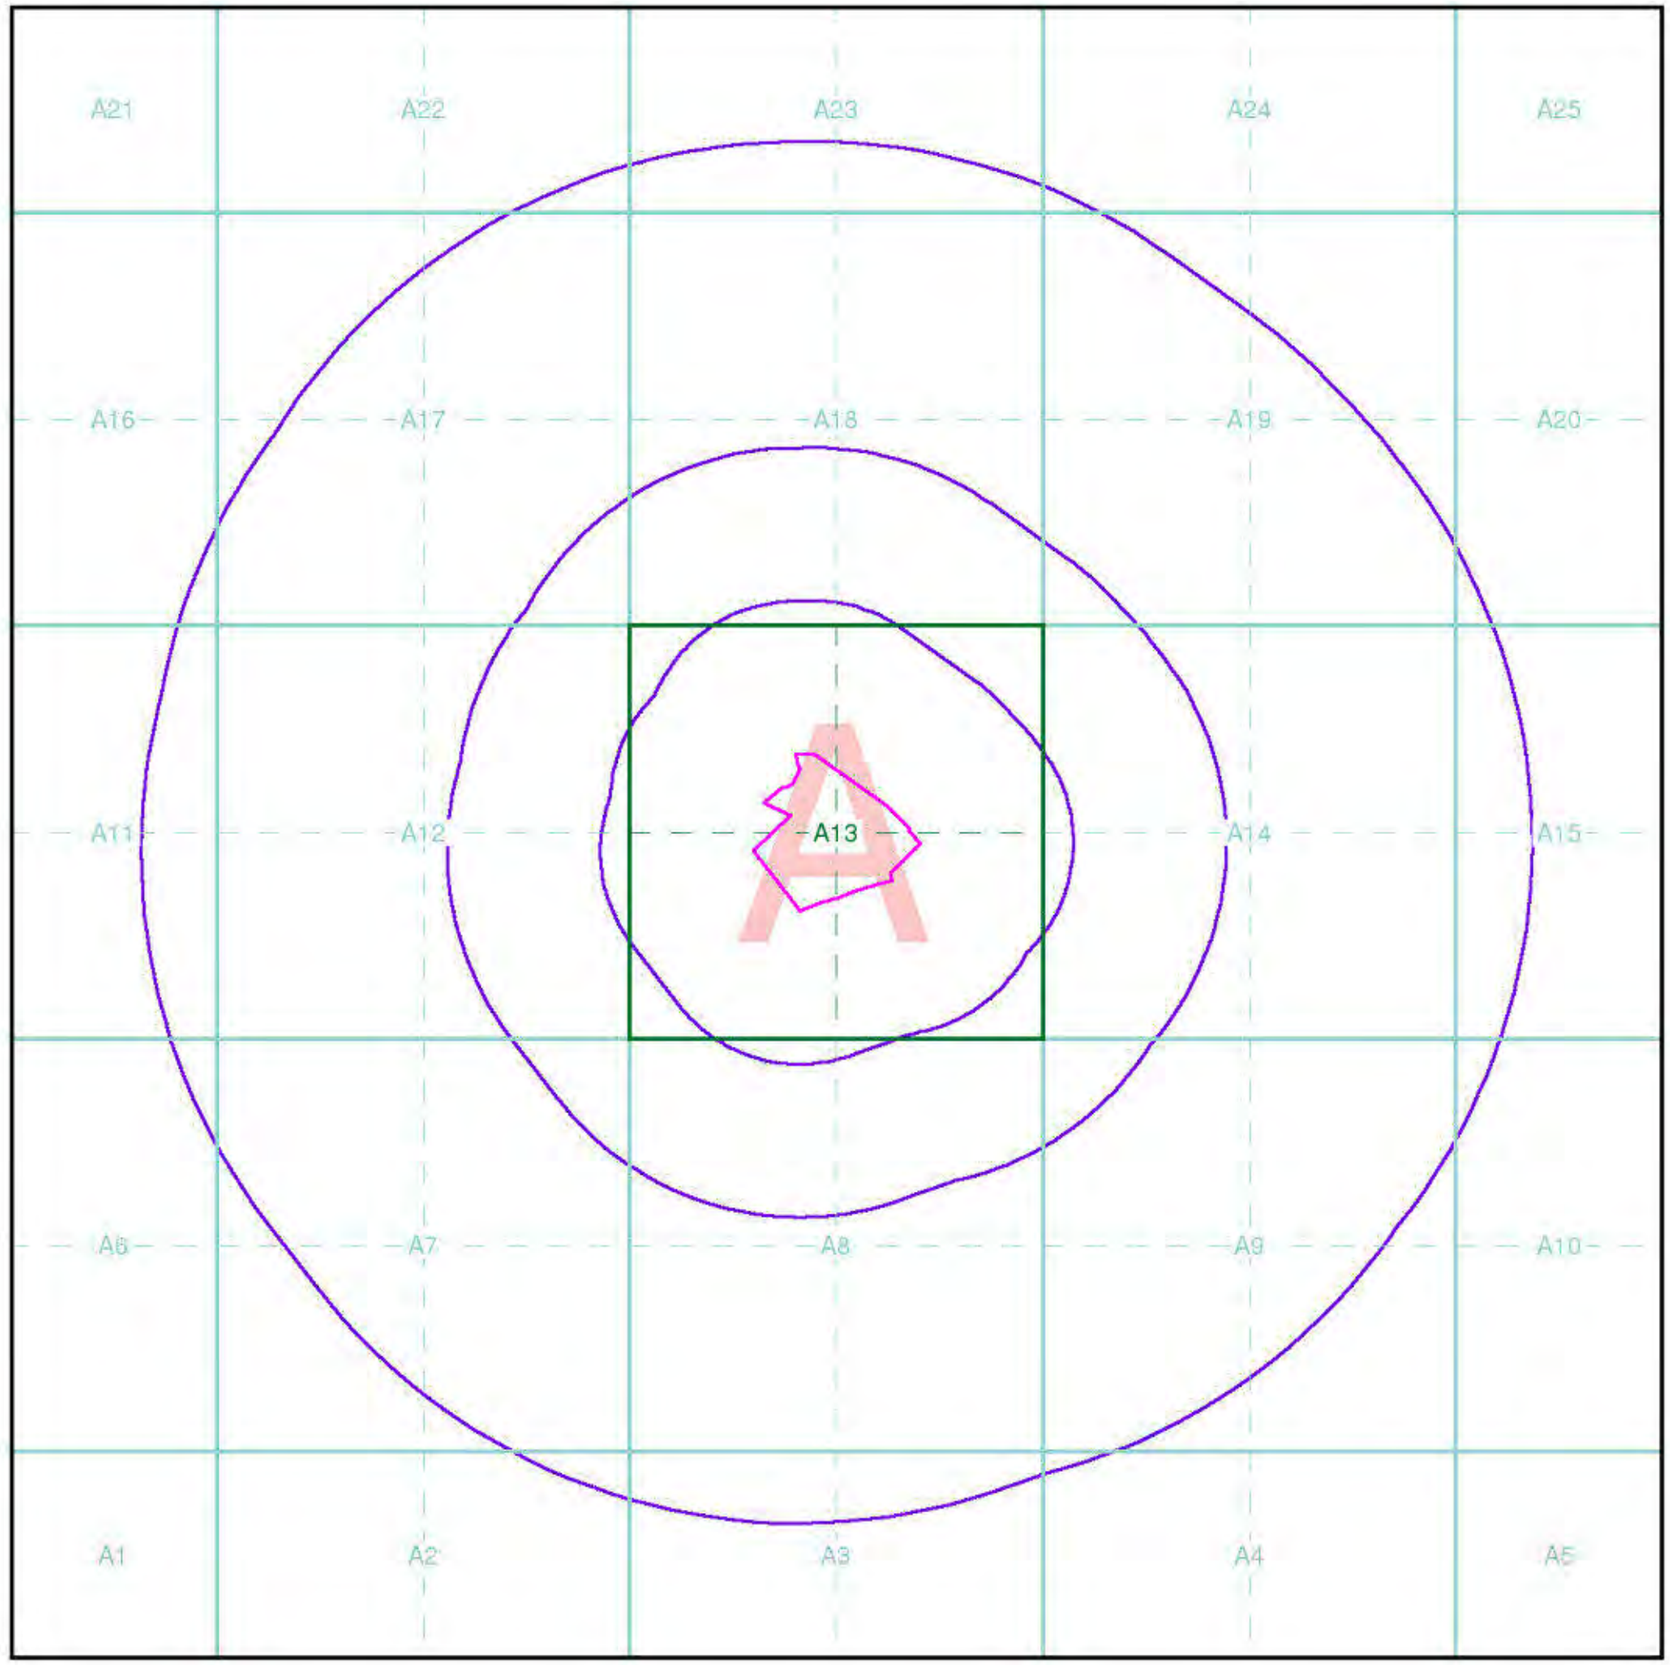
Historical Maps



TWEEDIE EVANS CONSULTING

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

Published 1968 - 1976

Source map scale - 1:1,250

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1974

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a `work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Additional SIMs

Published 1978 - 1991

Source map scale - 1:1,250

The SIM cards (Ordnance Survey's `Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1992 - 1993

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

Published 1947

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

Source map scale - 1:10,000

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2017

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

APPENDIX D

Regulatory Correspondence

Alexandra Flint

From: Benjamin Firmin <Benjamin.Firmin@stalbans.gov.uk>
Sent: 14 July 2017 09:22
To: Christina Jones
Subject: RE: Environmental search enquiry

Dear Christina,

I write further to your request for information regarding the above site. Please find responses to your questions below.

1. Pre-license landfill sites within 500m of the subject site, including:
    - license holder
    - location of landfill/grid reference
    - nature of fill material
    - dates of operation
    - details of any leachate/landfill gas problems

There are no pre-licence landfill sites within 500m of the subject site.

2. Pollution incidents/known areas of contaminated land within 500m of the subject site, including:
    - location/grid reference
    - previous uses
    - nature/source of pollution
    - any further details

There have been two pollution incidents within 500m of the subject site. These incidents relate to not yet known (05/10/1994) (RINC ID: THN11994031709) (PREMDESC: Not yet known) (TL 13700 04300) and oil/gas oil (14/11/1996) (RINC ID: THN11996026340) (PREM DESC: Industrial/other) (TL 13250 03800). The Council does not hold details of these incidents; however further information can be obtained from the Environment Agency.

There are no known areas of contaminated land within 500m of the subject site.

3. Part B APC authorisations within 500m of the subject site, including:
    - authorisation holder
    - location/grid reference
    - nature of authorisation

There are no Part B APC authorisations within 500m of the site.

4. Private water supplies within 500m of the subject site, including:
    - location/grid reference
    - details of source and abstraction purpose

There are no private water supplies within 500m of the subject site.

5. Storage of Petroleum Hydrocarbons.

There does not appear to be any sites where petroleum hydrocarbons are stored within 500m of the subject site.

6. Records of any previous Site Investigations on or in close proximity to the site

The Council does not hold any records of any previous Site Investigations on or in close proximity to the site.

7. Records of any unexploded ordnance in the site area

The Council does not hold any records of any unexploded ordnance in the site area.

8. Any known problems with ground gas in the site area

There are no known problems with ground gas in the site area.

9. Any potential issues regarding naturally elevated contaminant concentrations

I am not aware of any issues regarding naturally elevated contaminant concentrations.

10. Any other information held by your authority which may have an impact upon the contaminative status of the site

The site formed part of Burston Manor Farm (1880s) and later part of the Burston Nurseries (1970s-1990s).

There are areas of historic land-use within 500m of the target property which have the potential to give rise to contamination in the local area. Historic land-uses include a gravel pit (1800s), quarrying of sand & clay, operation of sand & gravel pits (the previously mention gravel pit) (1900) (1925) (1938) (1960), a nursery and the North Orbital Road (A405) (1940s), a garage and the Burston Nurseries (1950s-1970s) a hospital and the Burston Nurseries (1970s-1990s).

The Council's historical maps show that there is an area of unknown filled ground within 500m of the target property (Pit, quarry etc) (1990) (the previously mentioned gravel pit).

I hope that the information I have provided has helped with your query. If you require further clarification on this matter, please contact me on the below telephone number or via email.

Kind regards,

Ben Firmin MCIEH

To: Enviromental
Subject: Environmental search enquiry

RE: NORTH ORBITAL ROAD, ST ALBANS, AL2 2DS

Good morning,

I am writing to ask if you could conduct a search for the following details in order for us to complete an environmental review of the above mentioned site. The postcode for the site is AL2 2DS and the National Grid Reference is 513690, 203660. I have attached a site plan for your reference.

1. Pre-license landfill sites within 500m of the subject site, including:
    - license holder
    - location of landfill/grid reference
    - nature of fill material
    - dates of operation
    - details of any leachate/landfill gas problems

2. Pollution incidents/known areas of contaminated land within 500m of the subject site, including:
    - location/grid reference
    - previous uses
    - nature/source of pollution
    - any further details

3. Part B APC authorisations within 500m of the subject site, including:
    - authorisation holder
    - location/grid reference
    - nature of authorisation

4. Private water supplies within 500m of the subject site, including:
    - location/grid reference
    - details of source and abstraction purpose

5. Storage of Petroleum Hydrocarbons.

6. Records of any previous Site Investigations on or in close proximity to the site

7. Records of any unexploded ordnance in the site area

8. Any known problems with ground gas in the site area

9. Any potential issues regarding naturally elevated contaminant concentrations

10. Any other information held by your authority which may have an impact upon the contaminative status of the site

It would be extremely helpful if you could forward us these details at your earliest convenience.

If you require any further information please do not hesitate to contact me.

Yours sincerely,

Christina Jones

APPENDIX E

Risk Evaluation

Risk Evaluation

The qualitative assessment methodology presented in Ciria publication C552 (2001) titled *'Contaminated Land Risk Assessment: A Guide to Good Practice'* has been used by TEC for the basis of evaluating potential risk.

The method requires an assessment of the:

magnitude of the probability or likelihood of the risk occurring (Table 1); and
magnitude of the potential consequence or severity of the risk occurring (Table 2)

Table 1. Classification of Probability

Classification	Definition
High likelihood	There is a pollution linkage and an event that either appears very likely in the short-term and almost inevitable over the long-term, or there is evidence at the receptor of harm or pollution.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short-term and likely over the long-term.
Low likelihood	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such an event would take place, and is less likely in the short-term.
Unlikely	There is a pollution linkage but circumstances are such that it is improbable that an event would occur even in the very long-term.

Table 2. Classification of Consequence

Classification	Definition	Examples
Severe	Short-term (acute) risk to human health likely to result in "significant harm" as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution of sensitive water resource. (Note: Water Resources Act contains no scope for considering significance of pollution). Catastrophic damage to buildings/property. A short-term risk to a particular ecosystem, or organisation forming part of such ecosystem (note: the definitions of ecological systems within the draft circular on Contaminated Land, DETR, 2000).	High concentrations of cyanide on the surface of an informal recreation area. Major spillage of contaminants from site into controlled water. Explosion, causing building collapse (can also equate to a short-term human health risk if buildings are occupied).
Medium	Chronic damage to human health ("significant harm" as defined in DETR, 2000). Pollution of sensitive water resources. (Note: Water Resources Act contains no scope for considering significance of pollution). A significant change in a particular ecosystem, or organism forming part of such ecosystem, (note: the definitions of ecological systems within draft circular on Contaminated Land, DETR, 2000).	Concentration of a contaminant from site exceeding the generic or site-specific assessment criteria. Leaching of contaminants from a site to a major or minor aquifer. Death of a species within a designated nature reserve.
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services ("significant harm" as defined in the draft circular on Contaminated Land, DETR, 2000). Damage to sensitive buildings/structures/services or the environment.	Pollution of non-classified groundwater. Damage to building rendering it unsafe to occupy (for example foundation damage resulting in instability).
Minor	Harm, although not necessarily significant harm, which may result in a financial loss, or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing etc), easily repairable effects of damage to buildings, structures and services.	The presence of contaminants at such concentrations that protective equipment is required during site works. The loss of plants in a landscaping scheme. Discolouration of concrete.

The combination of the two factors is determined using Table 3 and the resulting level of risk is described in Table 4. The evaluation can be applied to each of the scenarios identified in the risk model and the overall risk assessed.

Table 3. Combination of Consequence with Probability

		Consequence			
		Severe	Medium	Mild	Minor
Probability	High Likelihood	**Very High Risk**	**High Risk**	**Moderate Risk**	**Moderate/Low Risk**
	Likely	**High Risk**	**Moderate Risk**	**Moderate/Low Risk**	**Low Risk**
	Low Likelihood	**Moderate Risk**	**Moderate/Low Risk**	**Low Risk**	**Very Low Risk**
	Unlikely	**Moderate/Low Risk**	**Low Risk**	**Very Low Risk**	**Very Low Risk**

Table 4. Description of risks and likely action required

Very High Risk	There is a high probability that severe harm could arise to a designated receptor from an identified hazard, or there is evidence that severe harm to a designated receptor is currently happening. This risk, if realised, is likely to result in a substantial liability. Urgent investigation (if not undertaken already) and remediation are likely to be required.
High Risk	Harm is likely to arise to a designated receptor from an identified hazard. Realisation of the risk is likely to present a substantial liability. Urgent investigation (if not undertaken already) is required and remedial works may be necessary in the short-term and are likely over the longer-term.
Moderate Risk	It is possible that harm could arise to a designated receptor from an identified hazard. However, it is either relatively unlikely that any such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild. Investigation (if not already undertaken) is normally required to clarify the risk and to determine the potential liability. Some remedial works may be required in the long-term.
Low Risk	It is possible that harm could arise to a designated receptor from an identified hazard, but it is likely that this harm, if realised, would at worst normally be mild.
Very Low Risk	There is a low possibility that harm could arise to a receptor. In the event of such harm being realised it is not likely to be severe.

Using the risk model the pollutant linkages are identified and a preliminary estimate of risk undertaken. If there is no pollutant linkage identified, then there is no risk. If the estimate of risk for all the linkages and exposure scenarios is very low at this stage then it is likely that no further assessment will be required.

* These descriptions are only intended to act as a cross check if sample identities are questioned. The major constituent of the sample is intended to act with respect to MCERTS validation. The laboratory is accredited for sand, clay and loam (MCERTS) soil types. Data for unaccredited types of solid should be interpreted with care.

Stone content of a sample is calculated as the % weight of the stones not passing a 10 mm sieve. Results are not corrected for stone content.

Lab Sample Number	Sample Reference	Sample Number	Depth (m)	Sample Description *
785277	WS01	None Supplied	0.10-0.20	Brown loam and sand with gravel and vegetation.
785278	WS02	None Supplied	0.10-0.20	Brown loam and clay with gravel and vegetation.
785279	WS03	None Supplied	0.10-0.20	Brown loam and clay with gravel and vegetation.

785281	WS05	None Supplied	0.10-0.30	Brown loam and sand with gravel.
785282	WS05	None Supplied	0.30-0.55	Brown loam and clay with gravel and brick.
785283	WS06	None Supplied	0.00-0.10	Brown loam and sand with gravel and vegetation.
785284	WS06	None Supplied	0.10-0.90	Brown clay and sand.
785285	WS07	None Supplied	0.10-0.60	Light brown loam and clay with gravel.
785286	WS08	None Supplied	0.10-0.20	Brown loam and sand with gravel and vegetation.

The results included within the report are representative of the samples submitted for analysis.

Analytical Report Number : 17-54809

Project / Site name: North Obrital Road, St Albans

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW) Process Water (PrW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Asbestos identification in soil	Asbestos Identification with the use of polarised light microscopy in conjunction with disperion staining techniques.	In house method based on HSG 248	A001-PL	D	ISO 17025
Boron, water soluble, in soil	Determination of water soluble boron in soil by hot water extract followed by ICP-OES.	In-house method based on Second Site Properties version 3	L038-PL	D	MCERTS
BTEX and MTBE in soil (Monoaromatics)	Determination of BTEX in soil by headspace GC-MS.	In-house method based on USEPA8260	L073B-PL	W	MCERTS
Hexavalent chromium in soil (Lower Level)	Determination of hexavalent chromium in soil by extraction in water then by acidification, addition of 1,5 diphenylcarbazide followed by colorimetry.	In-house method	L080-PL	W	MCERTS
Metals in soil by ICP-OES	Determination of metals in soil by aqua-regia digestion followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L038-PL	D	MCERTS
Moisture Content	Moisture content, determined gravimetrically.	In-house method based on BS1377 Part 2, 1990, Chemical and Electrochemical Tests	L019-UK/PL	W	NONE
Monohydric phenols in soil	Determination of phenols in soil by extraction with sodium hydroxide followed by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (skalar)	L080-PL	W	MCERTS
Pesticides and Herbicides in soil screening	In-house method	In-house method		W	NONE
pH in soil (automated)	Determination of pH in soil by addition of water followed by automated electrometric measurement.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L099-PL	D	MCERTS
Speciated EPA-16 PAHs in soil	Determination of PAH compounds in soil by extraction in dichloromethane and hexane followed by GC-MS with the use of surrogate and internal standards.	In-house method based on USEPA 8270	L064-PL	D	MCERTS
Stones content of soil	Standard preparation for all samples unless otherwise detailed. Gravimetric determination of stone > 10 mm as % dry weight.	In-house method based on British Standard Methods and MCERTS requirements.	L019-UK/PL	D	NONE
Sulphate, water soluble, in soil by Gallery 16hr	Determination of water soluble Sulphate by discrete analyser (precipitation method).	In house method based on BS1377-3: 1990.	L082B-PL	D	MCERTS
Sulphide in soil	Determination of sulphide in soil by acidification and heating to liberate hydrogen sulphide, trapped in an alkaline solution then assayed by ion selective electrode.	In-house method	L010-PL	D	MCERTS
Total cyanide in soil	Determination of total cyanide by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (Skalar)	L080-PL	W	MCERTS
Total organic carbon (Automated) in soil	Determination of organic matter in soil by oxidising with potassium dichromate followed by titration with iron (II) sulphate.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests""	L009-PL	D	MCERTS
Total sulphate (as SO4 in soil)	Determination of total sulphate in soil by extraction with 10% HCl followed by ICP-OES.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L038-PL	D	MCERTS
TPH Banding in Soil by FID	Determination of hexane extractable hydrocarbons in soil by GC-FID.	In-house method, TPH with carbon banding.	L076-PL	W	MCERTS

Analytical Report Number : 17-54809

Project / Site name: North Obrital Road, St Albans

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW) Process Water (PrW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
TPHCWG (Soil)	Determination of hexane extractable hydrocarbons in soil by GC-MS/GC-FID.	In-house method	L088/76-PL	W	MCERTS

For method numbers ending in 'UK' analysis have been carried out in our laboratory in the United Kingdom.
For method numbers ending in 'PL' analysis have been carried out in our laboratory in Poland.
Soil analytical results are expressed on a dry weight basis. Where analysis is carried out on as-received the results obtained are multiplied by a moisture correction factor that is determined gravimetrically using the moisture content which is carried out at a maximum of 30oC.

The results included within the report are representative of the samples submitted for analysis.

APPENDIX H

Soil Geotechnical Certificates of Analysis

LIQUID LIMIT, PLASTIC LIMIT AND PLASTICITY INDEX

				Job No.	23128

Date:	17/07/2017
Project:	North Orbital Road, St Albans
Project No.	1706007.001
Test No.	DCP1
Operator:	ML
Soil Type:	Made ground over clay/clayey sand
Surface Moisture:	Moderate

Notes/Comments

Notes:

1. CBR Value calculated using Jones C R and J Rolt (1991), "*Operating instructions for the TRL dynamic cone penetrometer*" (2nd edition). Information Note. Crowthorne: Transport Research Laboratory, as follows:

$$\text{Log}_{10}(\text{CBR}) = 2.48 - 1.057\ \text{Log}_{10}(\text{DPI})$$

2. Adjusted CBR vaules obtined from Table 4.2 of Simon Done and Piouslin Samuel (2006), "*Measuring Road Pavement Strength and Designing Low Volume Sealed Roads using the Dynamic Cone Penetrometer*" Unpublished TRL Project Report UPR/IE/76/06 Project Record No R7783.

The CBR Adjustment Factors are applied to unpaved roads on the assumption that the effect of moisture will be a maximum at the top surface and will reduce linearly to zero at a depth of 1000 mm.

Date:	17/07/2017
Project:	North Orbital Road, St Albans
Project No.	1706007.001
Test No.	DCP2
Operator:	ML
Soil Type:	Made ground over clay/clayey sand
Surface Moisture:	Moderate

Notes/Comments

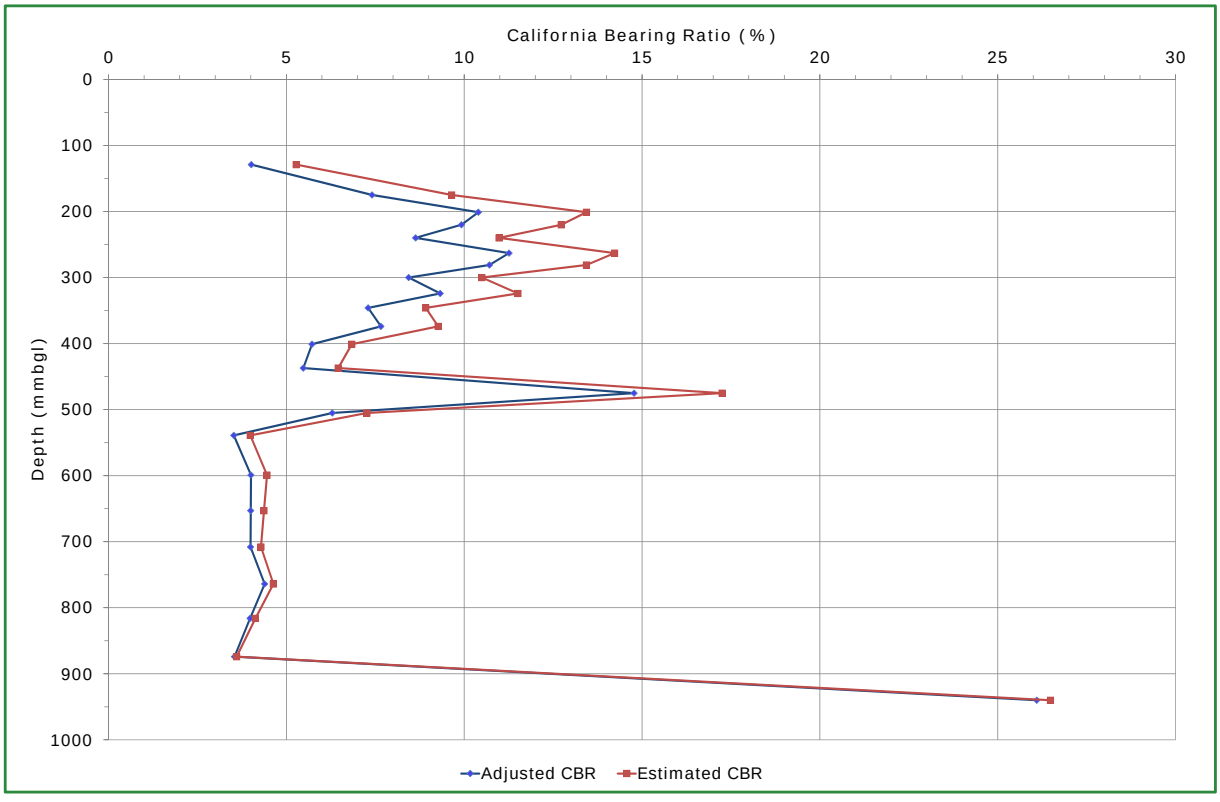
Notes:

1. CBR Value calculated using Jones C R and J Rolt (1991), "*Operating instructions for the TRL dynamic cone penetrometer*" (2nd edition). Information Note. Crowthorne: Transport Research Laboratory, as follows:

$$\text{Log}_{10}(\text{CBR}) = 2.48 - 1.057\ \text{Log}_{10}(\text{DPI})$$

2. Adjusted CBR vaules obtined from Table 4.2 of Simon Done and Piouslin Samuel (2006), "*Measuring Road Pavement Strength and Designing Low Volume Sealed Roads using the Dynamic Cone Penetrometer*" Unpublished TRL Project Report UPR/IE/76/06 Project Record No R7783.

The CBR Adjustment Factors are applied to unpaved roads on the assumption that the effect of moisture will be a maximum at the top surface and will reduce linearly to zero at a depth of 1000 mm.



Dynamic Cone Penetration Test Data (DCP-TRL)

North Orbital Road, St Albans **DCP3**

Cumulative Blow Count	Penetration (mm)	Penetration Index (DPI) mm/blow	Estimated CBR[1] (%)	Adjusted CBR[2] (%)
0	108	-	-	-
1	132	24.0	10.5	7.9
2	146	14.0	18.6	14.0
